Remote Access

MACHINE ACCESS FROM ANYWHERE, AT ANYTIME

As a unique feature, DIAP allows you to connect securely to any device - PLC, PC or robot - connected to DIAP via Ethernet or WiFi from your office or on the go.

If you are a machine builder or system integrator, this means that you can assist your customers even after commissioning, and offer customized service agreements based on production data collected by DIAP.

As a manufacturing company, you will be able to access and service equipment located at multiple sites from one main location. All you need is a PC and the DIAP remote access application.

In both cases, travel and maintenance costs will be significantly reduced and daily operations will be simplified as everything is included in DIAP.

SECURE CLOUD CONNECTION

Using the DIAP remote access interface, communication is set up as a secure remote connection through the DIAP cloud. An outbound connection is created from the DIAP connected to the equipment, and communication is initiated via the secure communication channel already integrated in DIAP.

With DIAP Remote Access you control exactly which devices that you want to make available for remote access and how they can be reached. You can use the access e.g. to configure or make changes to a PLC or to set up a robot.

As soon as the connection is switched off in the DIAP remote access interface, all communication is terminated.

DIAP Remote Access is easy, secure and user-friendly.

HOW IT WORKS
